Forming fluids are a type of metal working fluids used in operations pertaining to the changing of shape and contour of metals. Forming fluids include rolling oils, drawing and stamping compounds, forging compounds, die-casting compounds, and hydroforming fluids. These liquids offer superior lubrication and corrosion protection and thus help prevent scratches or damage to the substrates during molding and fabrication.

These liquids offer superior lubrication and corrosion protection and thus help prevent scratches or damage to the substrates during molding and fabrication. Also, most of the forming fluids protect substrates from humidity or acidic conditions that are often encountered in industrial environments. These fluids are formulated using a range of additives that enhance the performance of the composition.
