Foundation Micro Pile Jet Grouting High Pressure Injection System is construction equipment used to inject cement slurry or grout into soil under high pressure while rotating and lifting the drill rod to form reinforced columns or micro pile structures. It improves foundation bearing capacity, seepage control and ground stability in confined or complex sites. Applications include building foundations, subway construction, tunnels, embankments, slope stabilization and urban renewal projects. The market includes high-pressure pumps, rotary injection units and integrated grouting systems, but excludes ordinary concrete pumps and general drilling rigs without jet grouting functions.

The industry chain includes high-pressure pumps, drill rods, nozzles, rotary heads, hydraulic systems, motors, control panels, hoses, valves, cement slurry mixers and

wear-resistant components. Midstream production covers mechanical design, pump assembly, hydraulic integration, pressure testing, control calibration, safety testing and system commissioning. Downstream demand comes from foundation contractors, geotechnical engineering firms, tunnel projects, rail transit, municipal construction, water conservancy and building renovation. Growth is driven by urban underground construction, foundation reinforcement, soft soil treatment and infrastructure maintenance.
