A four channel coagulation analyzer is a medical device used to measure the coagulation ability of blood. It is used in clinical laboratories to perform coagulation tests on patient samples. Analyzers typically have four independent channels, each of which can run different tests simultaneously. This allows for effective testing and analysis of multiple samples simultaneously. Coagulation testing is important for diagnosing and monitoring hemorrhagic diseases, as well as evaluating the risk of thrombosis. The four channel coagulation analyzer can perform a series of tests, including prothrombin time (PT), activated partial thromboplastin time (aPTT), fibrinogen, and D-dimer tests. The working principle of the analyzer is to add reagents to the patient's blood sample and measure the time required for blood clotting. Then analyze the results and report them to the clinical doctor. The four channel coagulation analyzer is a valuable tool for diagnosing and monitoring coagulation disorders, which can help healthcare providers make informed decisions about patient care.
