According to our (Global Info Research) latest study, the global Fourier Transform Infrared Spectrometers market size was valued at USD 315.5 million in 2023 and is forecast to a readjusted size of USD 399.9 million by 2030 with a CAGR of 3.4% during review period.

FT-IR stands for Fourier Transform InfraRed, the preferred method of infrared spectroscopy. In infrared spectrometer, IR radiation is passed through a sample. Some of the infrared radiation is absorbed by the sample and some of it is passed through (transmitted). The resulting spectrum represents the molecular absorption and transmission, creating a molecular fingerprint of the sample. Like a fingerprint no two unique molecular structures produce the same infrared spectrum. This makes infrared spectroscopy useful for several types of analysis.

FTIR spectrometers (Fourier Transform Infrared Spectrometer) are widely used in organic synthesis, polymer science, petrochemical engineering, pharmaceutical industry and food analysis. In addition, since FTIR spectrometers can be hyphenated to chromatography, the mechanism of chemical reactions and the detection of unstable substances can be investigated with such instruments

We selected a total of 11 companies as samples. The 11 companies account for about 76% of the industry's market share. We can think that this is a relatively concentrated market, mainly because there is a high technical threshold and brand awareness, so the degree of concentration is high. And these are big companies.
