The global FPD Metrology and Inspection Equipment market size is expected to reach \$ 2088 million by 2032, rising at a market growth of 5.8% CAGR during the forecast period (2026-2032).

FPD Inspection and Metrology Equipment refers to dedicated inspection, measurement, testing and process-control equipment used across the manufacturing flow of LCD, OLED, AMOLED, Mini LED, Micro LED, Micro OLED, automotive displays, near-eye displays and other flat-panel display devices. These tools are deployed in glass substrate, TFT array, color filter, cell, module, touch-panel, flexible-display, micro-display and next-generation emissive-display processes to detect or measure particles, foreign materials, scratches, open and short defects, mura, pixel defects, emission abnormalities, luminance, chromaticity, film thickness, critical dimensions, overlay, uniformity, electrical characteristics, aging reliability and functional display performance. A typical system integrates precision optics, lighting modules, motion stages, probes or electrical-test units, pattern generators, image-processing algorithms, AI-based defect classification, data-acquisition modules and yield-management interfaces.

In terms of price, FPD Inspection and Metrology Equipment involves many types of equipment, and the prices vary greatly. For example, the price range of Cell optical inspection equipment is RMB 2.3-4.5 million per unit; Module optical inspection equipment is 2-3 times the price. The overall gross profit margin range of the global market falls around 40-45%.

During the mature LCD phase, inspection equipment was primarily used for defect interception and yield maintenance across Array, CF, Cell and LCM processes. As the industry moves toward OLED, flexible OLED, Micro OLED and Micro LED, the

inspection focus has shifted from large-area glass substrates and circuit-pattern defects to emissive-pixel consistency, LLO defects, Mura, luminance and chromaticity uniformity, EL / PL response, DeMura and near-eye display optical performance.

From the supply side, mainland Chinese companies are rapidly filling gaps in display module testing, OLED inspection, Micro OLED / Micro LED inspection, front-end Array metrology and machine-vision-based system integration. Taiwanese suppliers continue to maintain strong engineering capabilities in FPD AOI, display testing and Micro LED / Micro OLED inspection and metrology. Korean equipment vendors, meanwhile, have formed a dense supplier cluster around OLED AOI, OLED test, Mura, DeMura, OLED mask inspection and Micro LED EL / PL inspection.

On the demand side, the core driver is no longer traditional LCD capacity expansion, but the rising inspection complexity brought by IT OLED adoption, higher reliability requirements for automotive displays, Micro OLED near-eye displays and Micro LED industrialization. BOE has disclosed that its Chengdu Gen 8.6 AMOLED production line involves a total investment of approximately RMB 63 billion, while LG Display has also announced a KRW 1.26 trillion investment in new OLED technology infrastructure. These investments in high-generation OLED and next-generation OLED technologies will directly drive demand for Array, Cell, Module, aging, Mura / DeMura, optical metrology and final test equipment.

Compared with traditional LCD, OLED and Micro LED place a higher value on inspection because each emissive pixel itself becomes a potential quality-risk point. Inspection equipment must not only identify visible defects, but also participate in process control for luminance, chromaticity, uniformity and lifetime consistency.
