Abstracts

According to our (Global Info Research) latest study, the global FPR2 Agonists and Antagonists market size was valued at US\$ 130 million in 2025 and is forecast to a readjusted size of US\$ 359 million by 2032 with a CAGR of 16.0% during review period.

The FPR2 agonist and antagonist industry has a gross profit margin of 50%-70%.

FPR2 agonists: Molecules that bind to N-formyl peptide receptor 2 (FPR2/ALX) and activate the receptor conformation and downstream signal transduction (which can manifest as complete agonism, partial agonism, or 'biased agonism'). A common characteristic of the FPR2 system is that the ligand can induce different signal biases and biological effects (e.g., pro-inflammatory or pro-inflammatory resolution/repair), therefore, research and development often further subdivides according to 'bias.'

FPR2 antagonists are peptides that bind to FPR2 and block receptor activation induced by agonists (typically manifested as inhibition of Ca²⁺ mobilization, chemotaxis, and other readouts). They are used in tool research or potential therapeutic strategies to 'inhibit certain pathological responses mediated by FPR2.' Some commonly used tool antagonist peptides (e.g., WRW4) are frequently used to validate the specificity of FPR2-related effects.

From a 'raw material' perspective, FPR2 agonists/antagonists most commonly fall into two categories in research and development and supply: peptides and small molecules/lipids. Peptides (many tool agonist and antagonist peptides) are typically synthesized using solid-phase peptide synthesis (SPPS): the main raw materials are amino acid monomers, resin carriers, coupling/deprotection reagents, and large

amounts of organic solvents, and they are highly dependent on HPLC purification and mass spectrometry analysis for release. Therefore, the cost structure often shows a high proportion of 'purification and detection,' with longer sequences, more hydrophobic sequences, or a greater likelihood of byproduct formation increasing the unit cost. Upgrading from research-grade to GMP-grade significantly increases costs due to additional documentation, validation, and more stringent testing.

For FPR2 agonist routes involving lipid mediators/lipoxygen-like molecules (or their mimics), the raw materials often come from chiral/unsaturated fragments, protecting groups, and solvents required for multi-step organic synthesis. This makes the cost more easily amplified by factors such as chemical instability, isomer control, low-temperature and light-protected storage and transportation, and complex purification. This is why many R&D efforts shift towards more stable mimics/small molecule agonists with better physicochemical properties to improve manufacturability and cost control.

Overall conclusion: Under the same purity and traceability requirements, short peptides have relatively more predictable costs but are expensive to purify and detect; lipids/complex small molecules are more affected by synthetic difficulty and stability/storage and transportation, resulting in greater fluctuations in unit cost.
