Abstracts

The global Fractional Flow Reserve market size is expected to reach \$ 2601 million by 2032, rising at a market growth of 11.0% CAGR during the forecast period (2026-2032).

Fractional flow reserve (FFR) is a technique used in coronary catheterization to measure pressure differences across a coronary artery stenosis (narrowing, usually due to atherosclerosis) to determine the likelihood that the stenosis impedes oxygen delivery to the heart muscle (myocardial ischemia). FFR is a novel and potentially clinically useful mathematical solution for estimation of stenotic coronary artery atherosclerosis. Reliability/collaborative measurement between capable laboratories in measuring this essential metric appears muddled in a proprietary race to claim cardiac mathematics dedicated to risk in ischemic cardiac disease. Proprietary claims of cardiac mathematics have not been previously argued in patent law. Fractional flow reserve is defined as the pressure after (distal to) a stenosis relative to the pressure before the stenosis. The result is an absolute number; an FFR of 0.80 means that a given stenosis causes a 20% drop in blood pressure. In other words, FFR expresses the maximal flow down a vessel in the presence of a stenosis compared to the maximal flow in the hypothetical absence of the stenosis. This report studies the device for Fractional Flow Reserve.

Global Fractional Flow Reserve key players include Philips, Abbott, Boston Scientific, Bracco, Opsens, etc. Global top five manufacturers hold a share about 95%. North America is the largest market, with a share about 45%, followed by Europe, with a share about 25 percent. In terms of application, the largest application is Multi-vessel disease, occupied for a share of 63%.
