Abstracts

According to our (Global Info Research) latest study, the global Fractionator market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A Fractionator is a distillation tower used to separate a mixture of liquids with different boiling points into its individual components. These components are called fractions, hence the name. It works by exploiting the varying volatilities (boiling points) of the components in the mixture. More volatile components (lower boiling points) vaporize and rise in the tower, while less volatile components (higher boiling points) remain as liquid and travel down.
