The global Free Float Steam Trap market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Free Float Steam Trap is a trap device used to remove condensate and other unwanted liquids in steam systems. Its working principle is based on the buoyancy change of the float, which is used to control the opening and closing of the valve.

The main advantages of free-float steam traps include their automatic operation, without the need for an external energy supply, and their ability to adapt to different load and pressure conditions. This type of trap is commonly used in many steam systems to ensure the proper operation of pipes and equipment and to improve energy efficiency as they help reduce the waste of steam, thereby saving energy costs.
