Abstracts

The global Freeze-Dried Donor Breast Milk market size is expected to reach \$ 413 million by 2032, rising at a market growth of 14.8% CAGR during the forecast period (2026-2032).

Freeze-Dried Donor Breast Milk refers to a powdered product processed from breast milk donated by qualified donors through lyophilization (freeze-drying) technology. It is produced in strict compliance with human milk bank standards, involving donor screening (for infectious diseases), pasteurization, low-temperature freezing, and vacuum sublimation to remove water, which maximizes the retention of bioactive components such as immunoglobulins and lactoferrin while avoiding nutritional damage caused by high temperatures. With no chemical additives, it features long shelf life (up to 2 years), easy storage and transportation, and serves as a safe and nutritious alternative for infants who cannot obtain sufficient maternal breast milk, especially premature and low-birth-weight infants.

Global demand for Freeze-Dried Donor Breast Milk is growing rapidly, driven by rising parental attention to infant immune health, increasing demand from special medical scenarios such as neonatal intensive care units, and the rigid needs of working mothers for long-term breast milk preservation. Business opportunities lie in establishing standardized production lines compliant with international human milk bank norms to ensure product safety and traceability, developing customized products for premature infants and infants with special physical conditions, expanding distribution channels through cooperation with maternal and child health institutions and professional maternal and child platforms, and leveraging digital technologies to build full-process traceability systems to enhance consumer trust, while exploring the potential of combining with maternal and child health services to form an integrated industrial ecology.
