Abstracts

According to our (Global Info Research) latest study, the global Freezer Roll Bond Evaporator market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The evaporator is an important component among the four major components of refrigeration. The low-temperature condensed liquid body exchanges heat with the outside air through the evaporator, vaporizes and absorbs heat, achieving the effect of refrigeration. It mainly consists of two parts: a heating chamber and an evaporation chamber. The heating chamber provides the heat required for evaporation to the liquid, promoting its boiling and vaporization; The evaporation chamber completely separates the gas-liquid phases. The steam generated in the heating chamber contains a large amount of liquid droplets. After entering the larger evaporation chamber, these liquids can be separated from the steam through their own condensation or defoaming device. Blow expansion evaporators are mainly used for freezing and refrigeration. The expansion evaporator of the freezer is the main heat exchange equipment of the refrigeration system, commonly known as the cold source. Low temperature and low pressure refrigerant evaporates (boils) into steam, absorbs the heat of the cooled material, lowers the temperature of the material, and achieves the purpose of freezing food.
