Abstracts

The Frozen Fat Apparatus uses the triglycerides in human body fat to be converted into solids at a low temperature of 5°C, and the frozen energy precisely controlled by the non-invasive freezing energy extraction device is delivered to the designated fat-melting site, and the designated site is eliminated in a targeted manner. After the fat cells in the designated part are cooled to a specific low temperature, the triglycerides are transformed from liquid to solid, and die after crystallization and aging. They are excreted through metabolism, and the fat in the body is gradually reduced, so as to achieve local fat-melting body sculpting. Effect.
