According to our (Global Info Research) latest study, the global Frequency Select MEMS Oscillator (FSMO) market size was valued at USD 1071.1 million in 2023 and is forecast to a readjusted size of USD 2306.4 million by 2030 with a CAGR of 11.6% during review period.

Frequency-selective MEMS oscillators usually use special micromechanical structures to achieve frequency selection. These structures include resonators, masses, springs, and feedback circuits. When an external excitation is applied, the resonator generates mechanical vibration at a specific frequency, which is amplified by a feedback circuit and fed back to the input, thereby producing an oscillation signal.

Frequency-selective MEMS oscillators have high frequency stability and good frequency-selective performance. They are suitable for various occasions that require high-precision and high-stable frequency signals, such as communications, navigation, radar and other fields.
