Abstracts

The global Frequency Sources market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Frequency source is the basic signal source of electronic system (radar, communication, measurement and control, navigation, etc.), mainly including fixed point frequency source and synthetic frequency source. Fixed point frequency oscillator is generally used to realize point frequency source with low frequency accuracy in microwave frequency band. Due to its high Q value, small size and easy to realize hybrid integration, dielectric oscillators are widely used to realize microwave integration, low phase noise and temperature stable point frequency sources, and can further improve frequency accuracy by constant temperature or temperature compensation. Synthetic frequency source, also known as frequency synthesizer or frequency synthesizer, can be divided into direct type and indirect type according to its composition. Direct frequency synthesizer uses frequency multiplier, frequency divider, mixer and microwave switch to realize frequency synthesis. It has the optimal near-end phase noise and high-speed frequency agility characteristics, but its complex structure and high cost limit its application in high-end applications such as radar. The indirect frequency synthesizer uses phase-locked loop (PLL) technology, which is currently the most widely used.
