According to our (Global Info Research) latest study, the global Froth Flotation Columns market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

Froth flotation columns are vertical tanks used in mineral processing for separating valuable minerals from waste material. They work on the principle of selective attachment of air bubbles to desired minerals. The mineral-bubble aggregates rise to the top, forming a froth layer that's skimmed off for further processing. Columns differ from traditional mechanical cells by using sparged air bubbles (introduced through diffusers) instead of mechanical agitation.
