Abstracts

According to our (Global Info Research) latest study, the global Full-Field Digital Mammography Unit market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The main consumer markets of the Full-Field Digital Mammography Unit are North America and Asia. With the gradual recovery of the global economy after the COVID-19 outbreak and the return of major economies to normal, the medical industry will see certain growth. More and more hospitals and clinics are able to carry out imaging tests. As a result, the demand for Full-Field Digital Mammography Unit will increase in the foreseeable future.

The Full-Field Digital Mammography Unit is a type of medical imaging device that uses digital technology to produce high-quality images of the breast tissue. It is also known as digital mammography or 2D mammography. In a full-field digital mammography unit, the patient's breast is compressed between two plates and an X-ray machine produces low-dose X-rays that pass through the breast tissue and are detected by electronic detectors. These detectors convert the X-rays into electrical signals, which are then used to create high-resolution digital images of the breast tissue. These images can be viewed on a computer screen and stored electronically. Compared to analog mammography units, full-field digital mammography units offer several advantages such as improved image quality, lower radiation exposure, and the ability to manipulate and enhance the images for better visualization of the breast tissue. They are also able to detect smaller abnormalities in the breast tissue, making them more effective in

detecting early-stage breast cancer.
