According to our (Global Info Research) latest study, the global Full-frame Mirrorless Camera market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A Full-frame Mirrorless Camera is a type of digital camera that features a mirrorless design and utilizes a full-frame image sensor. Full frame refers to traditional 35mm film cameras. In the past, the image sensors of digital cameras were small, but with the maturity of technology, image sensors have also achieved large sizes, 36?24mm, which is close to the size of traditional 35mm film, so full-frame digital cameras have been developed. Generally speaking, the larger the image sensor size, the better the image quality, and it can also achieve a wider time for shooting. The larger the CMOS size, the higher the image quality, so the full-frame camera has better image quality and richer details. Therefore, relatively speaking, the picture quality details and sensitivity range of full-frame cameras when taking pictures are better than those of half-frame cameras. In addition, there are differences in depth of field, tolerance and vignetting. Under the same circumstances, the depth of field of full-frame cameras is shallower than that of half-frame cameras, and full-frame cameras can show greater contrast. Half-frame cameras are not prone to vignetting at large apertures, but full-frame cameras may have vignetting.
