Abstracts

The global Full Spectrum LED Grow Light market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Full Spectrum LED Grow Light is an artificial light source with a full spectrum developed by simulating the principle of solar spectrum ratio according to the law of plant growth. It has a wide radiation range and reaches more than 100LM per watt, which truly meets the requirements of green lighting.

For agricultural greenhouses, as a supplementary light, the light can be enhanced at any time of the day to always help plants photosynthesize. Especially in the winter months, the effective lighting time can be extended. No matter at dusk or night, it can effectively prolong and scientifically control the light required by plants without being affected by any environmental changes.

In a greenhouse or plant laboratory, it can completely replace natural light to promote plant growth.

Full Spectrum LED Grow Light is a lighting source developed by simulating the solar spectrum, which is beneficial to plant growth. The visible light in the spectrum is in a reasonable proportion from the blue part of 380NM to the red part of 780NM, and the light wave curve imitates the shape of the solar spectrum. The light color is like 10 o'clock in the morning Left and right daylight colors, strong color rendering, small color temperature drift, high luminous efficiency, and large luminous flux.
