Abstracts

The global Full Tab Ternary (NCM/NCA) Lithium Cells market size is expected to reach \$ 3184 million by 2032, rising at a market growth of 26.4% CAGR during the forecast period (2026-2032).

Full Tab Ternary (NCM/NCA) Lithium Cells are lithium-ion cells that combine a full-tab current-collection structure with ternary cathode systems such as NCM or NCA, designed to deliver higher energy density, stronger high-rate discharge capability, improved heat dissipation, and better stability under high-load operation. Compared with conventional ternary lithium cells using standard tab structures, their advantages lie in lower internal resistance, faster current transmission, stronger power output, better thermal control, and higher suitability for compact high-power battery packs. In 2025, production was approximately 240 million units and the average price was USD 2.5 per unit. The industry's capacity utilization rate in 2025 was about 65% and the average gross margin was around 25%. Upstream, the key materials include ternary cathode materials, anode materials, and separators, with representative suppliers such as BTR, Shanshan, and Yunnan Energy New Material supporting the core material system for high-performance lithium-ion cells. The midstream segment focuses on full-tab ternary cell structure design, NCM/NCA electrode formulation, current-collection path optimization, winding process control, electrode welding, electrolyte injection, formation and grading, safety testing, consistency management, thermal performance verification, and automated mass production, which together determine energy density, power output, heat dissipation, cycle life, safety reliability, and cost competitiveness. Downstream, Full Tab Ternary (NCM/NCA) Lithium Cells are mainly used in power tools, portable energy storage, and data center backup batteries.

Full Tab Ternary (NCM/NCA) Lithium Cells will be driven by applications that require

both high energy density and strong power delivery. In power tools, the full-tab structure helps ternary cells release high current more efficiently while controlling heat during frequent load changes. In portable energy storage, the advantage is a better balance between compact size, endurance, and output power. For data center backup batteries, stable pulse discharge, consistency, and thermal safety become more important during emergency switching. As downstream customers raise requirements for energy, power, and reliability at the same time, competition will shift toward full-tab design, ternary material stability, welding quality, and cell consistency.
