A full waveform IP receiver is an instrument used for geophysical exploration to measure the electrical characteristics of the underground. Induced polarization refers to a technique that detects the presence of certain minerals by measuring the response of underground materials to applied currents. The full waveform IP receiver aims to measure the complete waveform of the electrical signal generated by the IP source. This allows for more detailed underground analysis, as the complete waveform contains more information than the amplitude and phase of the signal. This instrument typically includes a receiver unit and a set of electrodes for applying current to the ground. The receiver unit records electrical signals and sends them to the computer for analysis. Full waveform IP receivers are typically used in conjunction with other geophysical instruments such as seismic sensors and magnetometers to obtain more complete underground images. It is usually used for mineral exploration because certain minerals have unique electrical properties that can be detected using IP technology.
