The fully automated biochemical analysis system is an automated laboratory instrument used for quantitative analysis of various biomarkers in biological samples such as blood, urine, and saliva. It aims to improve the efficiency and accuracy of laboratory workflows by reducing labor, minimizing errors, and improving throughput. The fully automated biochemical analysis system can analyze multiple analytes simultaneously, making it a universal tool for clinical and research applications. It is commonly used in clinical laboratories for the diagnosis and monitoring of various diseases, including metabolic disorders, liver and kidney function tests, and blood lipid profiles. Compared to traditional manual techniques, fully automated biochemical analysis systems have many advantages, including higher throughput, higher accuracy and precision, and shorter turnaround times. In addition, the system requires less labor, reducing the risk of human error, and improving the reliability and reproducibility of the results.
