The fully automatic coating machine is a highly automated mechanical equipment specially designed to apply paint or fluid accurately and evenly on the surface of the product. The working principle of the fully automatic coating machine is mainly to evenly apply the paint on the surface of the material through the coating head, and then solidify the paint through the drying equipment. This process usually consists of four main parts: conveying system, coating system, drying system and control system. The conveying system is responsible for conveying the material to be coated to the coating machine, the coating system is responsible for evenly applying the paint on the surface of the material, the drying system is used to accelerate the curing and drying of the paint, and the control system is used to monitor and control the various parameters of the coating machine.

Fully automatic coating machines are widely used in various fields, such as electronics, optoelectronics, semiconductors, medical devices, automobiles, aerospace, etc. In the field of electronics, fully automatic coating machines can be used to coat circuit boards, electronic components, etc., providing waterproof, dustproof and anti-corrosion protection; in the field of medical devices, they can be used to coat medical materials

and equipment to ensure their safety and hygiene; in the automotive and aerospace fields, they can be used to coat automotive parts and aircraft parts, etc., providing thermal resistance, moisture resistance and anti-corrosion protection.
