## Abstracts

A Semiconductor Laser Scribe Machine is a vital tool used in the process of singulating, or separating, individual die (integrated circuits) from a larger silicon wafer during integrated circuit (IC) manufacturing.

According to our (Global Info Research) latest study, the global Fully Automatic Semiconductor Laser Scribe Machine market size was valued at US\$ 430 million in 2023 and is forecast to a readjusted size of USD 628 million by 2030 with a CAGR of 7.0% during review period.

The Semiconductor Laser Scribe Machine market is experiencing significant growth, driven by several key factors:

### 1. Rising Demand for Integrated Circuits (ICs):

The ever-increasing demand for electronic devices like smartphones, laptops, and Internet-of-Things (IoT) gadgets translates directly to a growing need for ICs.

As chip complexity increases, more die (individual circuits) are placed on each wafer. Laser scribing becomes crucial for efficiently separating these die from the larger wafer.

### 2. Miniaturization and Advanced Packaging:

The trend towards smaller and more powerful ICs necessitates precise singulation techniques like laser scribing.

Advanced packaging technologies, like Fan-Out Wafer-Level Packaging (FOWLP) and Package-on-Package (PoP), involve stacking multiple die. Laser scribing offers the necessary control and flexibility for singulation in these scenarios.

### 3. Advantages of Laser Scribing over Dicing:

Compared to traditional dicing (sawing), laser scribing offers several advantages:

**Higher Precision:** Laser beams create cleaner and more precise scribes with minimal material damage.

**Reduced Heat-Affected Zone (HAZ):** Minimized heat generation protects sensitive circuitry within the die.

**Flexibility:** Adaptable to various wafer sizes and die shapes
