According to our (Global Info Research) latest study, the global Fully Automatic Specific Protein Analyzer (Immunoturbidimetry) market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The fully automatic specific protein analyzer (immunoturbidimetry) is an instrument used to detect the content of specific proteins in body fluids. Immunoturbidimetry is an analytical method that combines the particle enhancement effect and turbidity measurement technology by utilizing immunological principles. In immunoturbidimetry, specific proteins in the sample combine with specific antibodies to form immune complexes, and then latex particles or other particle-labeled antibodies are added to cause the immune complexes to react and form large particle complexes. These complexes cause an increase in solution turbidity, which is proportional to the concentration of a specific protein in the sample. Complete

The fully automatic specific protein analyzer (immunoturbidimetric method) can accurately and quickly determine the content of specific proteins in samples, and has the characteristics of high throughput, high sensitivity and high precision. The instrument includes an automated sample processing system, optical detection system and data analysis system, which can achieve efficient analysis of large batches of samples, reduce human operating errors, and improve the reliability of experimental results.
