In the diagnosis of fungal skin diseases, healthcare professionals often employ the use of a Wood's lamp and KOH preparation. The Wood's lamp, emitting ultraviolet light, is particularly effective in detecting fungal infections that fluoresce under UV light, such as certain dermatophyte infections. This non-invasive tool aids in the initial identification of potential fungal sources on the skin or scalp. Additionally, the KOH preparation involves mixing skin or nail scrapings with potassium hydroxide, enabling the destruction of non-fungal structures and the visualization of fungal elements under a microscope. Together, these diagnostic techniques play a crucial role in identifying the presence
