Abstracts

According to our (Global Info Research) latest study, the global Furmonertinib Mesylate market size was valued at US\$ 971 million in 2025 and is forecast to a readjusted size of US\$ 1934 million by 2032 with a CAGR of 11.6% during review period.

In 2025, global Furmonertinib Mesylate Tablets production reached approximately 380,000 units. Furmonertinib Mesylate is an oral third-generation epidermal growth factor receptor (EGFR) tyrosine kinase inhibitor (TKI), primarily used for the treatment of patients with non-small cell lung cancer (NSCLC) harboring EGFR-sensitive mutations or the T790M resistance mutation. It works by selectively and irreversibly inhibiting the kinase activity of mutant EGFR, thereby blocking tumor cell proliferation and survival signaling pathways and suppressing tumor growth. Furmonertinib mesylate is characterized by high selectivity for mutant EGFR, good central nervous system penetration, and a relatively manageable safety profile, making it clinically valuable in the treatment of advanced non-small cell lung cancer.

Furmonertinib Mesylate, as a third-generation epidermal growth factor receptor (EGFR) tyrosine kinase inhibitor (TKI), operates in a rapidly developing and highly competitive segment of the non-small cell lung cancer (NSCLC) targeted therapy market, particularly demonstrating strong competitiveness in patients with EGFR mutations and T790M resistance mutations. With the large population of lung cancer patients and the continuous improvement in the penetration of genetic testing, the demand for precision medicine is steadily increasing, providing a solid market foundation for this class of drugs.

From a competitive landscape perspective, imported originator drugs represented by

Osimertinib have long dominated the market. However, furmonertinib mesylate, leveraging its domestic R&D advantages, price competitiveness, and potential efficacy in patients with central nervous system metastases, is gradually gaining market share in China.

On the policy side, its inclusion in the national reimbursement drug list helps improve patient accessibility and promote market expansion, although healthcare cost-control measures and volume-based procurement policies continue to exert pressure on pricing. From a competitive standpoint, multiple third-generation EGFR-TKIs and next-generation targeted therapies from both domestic and international companies are continuously entering the market. In addition, the development of immunotherapy combination regimens is further intensifying competition. Therefore, the future market performance of furmonertinib mesylate will depend on its penetration in first-line treatment, expansion of indications (such as adjuvant therapy or additional mutation subtypes), and the accumulation of real-world evidence, as well as its overall competitive balance in terms of efficacy, safety, and pricing.
