## Abstracts

The global Furnace Molten Iron Composition Analyzer market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

The thermal analysis technology of hot metal is derived from the phase diagram theory in metallography. Developed countries have widely used it in the analysis and control of molten iron in front of the furnace. It is an indispensable detection method in advanced casting technology. It plays a very important role in producing high-quality castings. Anyone engaged in casting technology knows that the carbon equilibrium phase diagram is a basic tool for the research and production of metal materials. Some people call the cooling curve in the thermal analysis of castings the fingerprint of metallurgical quality. The basic principle of rapid prediction of furnace casting thermal analysis is to record the cooling curve of the molten iron in a specific carbon cup through a thermal analysis instrument. The iron-carbon equilibrium phase diagram reflects the quantitative relationship between the composition of molten iron and the phase transition temperature during the solidification process. The state of the solidification phase transition temperature of molten iron has a certain relationship with various properties of cast iron. We use this relationship to predict various parameters of metal materials and control the production process. The method of iron-carbon balance diagram is similar to the molten iron cooling curve of thermal analysis technology. The difference between them is that the results of the carbon balance diagram are determined under ideal conditions. However, the cooling curve of thermal analysis technology is determined by the actual production conditions of molten iron. Its composition is relatively complex. The shape of the cooling curve is somewhat different from the standard state. But this difference can represent the actual state of molten iron. We use the actual cooling curve of iron for quality analysis and control, which is closer to production practice.
