## Abstracts

Fused ceramic sand for foundry is a type of molding material used in metal casting processes. It is made by fusing high-quality silica sand with ceramic materials at high temperatures. This process creates a material with excellent thermal stability, high refractoriness, and good strength, making it ideal for use in foundry applications. Fused ceramic sand is used as a molding material in foundries to create molds and cores for casting metals. It is particularly well-suited for casting high-temperature alloys and metals that require precise casting dimensions. The material's thermal stability allows it to withstand the high temperatures of molten metal without deforming, ensuring the integrity of the casting process. In addition to its thermal properties, fused ceramic sand also offers good flowability, which helps ensure that it fills the mold cavity evenly and completely. This results in high-quality castings with accurate dimensions and smooth surfaces. Overall, fused ceramic sand is a valuable material in foundry applications, offering a combination of thermal stability, strength, and flowability that makes it ideal for creating high-quality castings.
