According to our (Global Info Research) latest study, the global G.657.A2 Fiber market size was valued at US\$ 2289 million in 2025 and is forecast to a readjusted size of US\$ 19729 million by 2032 with a CAGR of 20.5% during review period.

G.657.A2 Fiber is a bend-insensitive single-mode fiber that complies with the ITU-T G.657.A2 standard. Its main feature is that it maintains low additional loss even at small bend radii while remaining compatible with conventional G.652.D single-mode fibers. Compared with standard G.652.D fibers, G.657.A2 fibers are better suited for high-density, short-radius, and complex routing environments, reducing link loss caused by bending during cabling, patching, fiber management, and maintenance.

G.657.A2 fibers are primarily manufactured from A2-class optical fiber preforms through drawing, coating, sorting, and testing, and are further processed into optical cables, patch cords, pigtails, and data center cabling products. Key application scenarios include high-density cabling in AI data centers, GPU cluster interconnections, patching inside and between racks, FTTH access networks, building cabling, campus networks, and small-bend-radius fiber connections. With the growing demand for AI data centers, cloud computing, and high-density optical interconnects, G.657.A2 fibers are transitioning from traditional access network materials to high-end fibers for AI computing infrastructure.

In 2025, the global shipment of G.657.A2 fibers was approximately 311.54 million fiber-kilometers, with an average price of USD 7.14 per fiber-kilometer and a gross margin of approximately 40%.

Demand for G.657.A2 Fiber is rising rapidly, essentially driven by the simultaneous

increase in fiber usage, cabling density, and bend-resistance requirements from AI data centers and high-density communication networks. Scenarios such as GPU clusters, switch interconnections, optical module connections, and high-density patch cords inside and between racks place higher requirements on fiber bend radius and link reliability. Conventional G.652.D fibers are more prone to bend loss under complex routing conditions, while G.657.A2 fibers, with stronger bend-insensitive performance, are becoming a key incremental fiber category for AI data centers, FTTH upgrades, and indoor high-density cabling. Public reports have also noted that AI data centers use significantly more fiber than traditional server architectures, contributing to fiber supply shortages and longer delivery lead times.

From the perspective of pricing and supply, G.657.A2 optical fiber has entered a clear upcycle. Some industry data indicate that G.657.A2 fiber prices rose rapidly in 2026, driven by growing AI infrastructure demand, tight preform supply, and insufficient capacity for high-end bend-insensitive optical fibers.

From the competitive landscape perspective, the G.657.A2 optical fiber market favors companies with integrated capabilities in preforms, fiber drawing, coating, optical cable manufacturing, and customer qualification. In the short term, price increases will significantly improve profitability for companies with A2 preform and A2 fiber capacity. In the medium to long term, as preform capacity expands and A2 fiber capacity is released, competition will shift back to product consistency, low bend loss, delivery stability, customer certification, and large-scale cost control. This product is not simply a conventional communication fiber, but a high-end single-mode fiber segment jointly driven by AI computing, data centers, FTTH, and high-density cabling demand.
