Abstracts

According to our (Global Info Research) latest study, the global GABAB Receptor Agonists market size was valued at US\$ 3334 million in 2025 and is forecast to a readjusted size of US\$ 4710 million by 2032 with a CAGR of 5.0% during review period.

GABAB receptor agonists are central nervous system prescription medicines that activate metabotropic GABAB receptors, inhibit presynaptic excitatory neurotransmitter release, and reduce neuronal excitability. Commercial products mainly include baclofen formulations used for spasticity associated with multiple sclerosis, spinal cord injury, and other neurological disorders, together with sodium oxybate and mixed oxybate salt products used for cataplexy, excessive daytime sleepiness in narcolepsy, and idiopathic hypersomnia. Major dosage forms include tablets, oral solutions, oral suspensions, oral granules, intrathecal injections, and extended-release oral suspensions. Upstream inputs mainly include baclofen, sodium oxybate, and mixed oxybate salt active ingredients, together with thickeners, sweeteners, extended-release materials, sterile injectable excipients, pharmaceutical packaging, and intrathecal pump-related consumables. Downstream customers mainly include neurology departments, rehabilitation centers, spinal cord injury centers, sleep medicine centers, specialty pharmacies, hospital pharmacies, and controlled-drug distribution organizations. Competition is relatively intense in standard baclofen tablets, while low-sodium oxybate, extended-release sodium oxybate, differentiated oral formulations, and intrathecal baclofen products retain higher added value, with an overall gross margin generally ranging from approximately 58% to 82%.

From the current market perspective, the GABAB receptor agonist market has a dual structure consisting of high-volume, low-priced baclofen products and high-priced

oxybate therapies used in relatively small patient populations. Baclofen is a mature treatment for spasticity and is available as generic tablets, oral liquids, concentrated suspensions, granules, and intrathecal injections. The oxybate segment is concentrated in narcolepsy and idiopathic hypersomnia and is led by a small number of specialty pharmaceutical companies.

Looking ahead, the baclofen segment will increasingly focus on liquid formulations, granules, and intrathecal products for pediatric, elderly, dysphagic, and severe-spasticity patients. Growth in standard tablets will remain limited. Oxybate development will focus on lower-sodium formulations, once-at-bedtime dosing, adherence improvement, and expansion in idiopathic hypersomnia. Sodium burden, nighttime redosing, dosing convenience, and controlled distribution will remain important competitive factors.

Key market drivers include spasticity associated with multiple sclerosis, spinal cord injury, cerebral palsy, stroke, and other central nervous system disorders. Improved diagnosis of narcolepsy and idiopathic hypersomnia, expansion of sleep medicine centers, and greater patient access are supporting demand for oxybate therapies. Low-sodium and extended-release formulations may improve patient conversion and persistence by addressing sodium exposure and nighttime dosing inconvenience.

The main constraints include somnolence, dizziness, muscle weakness, cognitive effects, and severe withdrawal associated with abrupt baclofen discontinuation. Intrathecal therapy requires an implanted pump and specialist management and may be affected by pump or catheter complications. Oxybates are tightly controlled central nervous system depressants associated with abuse, misuse, respiratory depression, and dangerous interactions with alcohol and sedatives. High treatment costs, insurance access, restricted distribution, and generic competition also constrain market growth.
