## Abstracts

Galactose, sometimes abbreviated Gal, is a monosaccharide sugar that is about as sweet as glucose, and about 30% as sweet as sucrose. It is a C-4 epimer of glucose. Sterol ester is created when sterol and a fatty acid are synthesised.

Pullulan is a polysaccharide polymer consisting of maltotriose units. Three glucose units in maltotriose are connected by an  $\alpha$ -1,4 glycosidic bond, whereas consecutive maltotriose units are connected to each other by an  $\alpha$ -1,6 glycosidic bond. Pullulan is produced from starch by the fungus *Aureobasidium pullulans*. Pullulan is mainly used by the cell to resist desiccation and predation. The presence of this polysaccharide also facilitates diffusion of molecules both into and out of the cell.

Sterol ester is a heterogeneous chemical compound found in small amounts in every cell type. Phytosterols is a collective term for plant-derived sterols and stanols that are found in the fatty tissues of plants.
