Abstracts

The global Gallium Acetylacetonate market size is expected to reach \$ 29.28 million by 2032, rising at a market growth of 6.1% CAGR during the forecast period (2026-2032).

Gallium Acetylacetonate, also known as Gallium(III) acetylacetonate or Ga(acac)₃, is a gallium-based coordination compound in which gallium is chelated by three acetylacetonate ligands. It is usually supplied as a white to pale yellow crystalline powder and is mainly used as a high-purity organometallic precursor for gallium-containing thin films, gallium oxide, nanomaterials, quantum dots, catalyst research, and electronic/optoelectronic material synthesis. Commercial products are commonly offered in 98%-99.999% purity grades, with high-purity grades used in CVD, ALD, thin-film deposition and advanced materials R&D. In 2025, global Gallium Acetylacetonate production reached approximately 12 MT.

Demand growth is mainly driven by gallium oxide, gallium nitride, quantum-dot, and advanced functional thin-film research and pilot-scale development. Fields such as gallium oxide power devices, deep-ultraviolet detection, transparent conductive or insulating layers, and functional coatings continue to evaluate gallium-containing precursors. Gallium Acetylacetonate benefits from a relatively clear thermal decomposition route, non-pyrophoric handling, and suitability for solution-based systems, giving it stable demand in laboratory research, prototype validation, and selected small-batch processes. Compared with highly reactive vapor-phase gallium sources, it is better suited to applications requiring milder handling conditions and dispersible precursor chemistry.

On the supply side, the market is still led by high-purity metal-organic producers in the United States and Europe, while the number of manufacturers capable of batch

traceability, metal impurity control, and technical documentation support remains limited. China has many reagent-grade and trading-oriented suppliers, but fewer companies with official product pages, batch consistency, and validation by electronic-material customers. Future growth is expected to come more from high-purity grades, customized impurity control, kilogram-scale packaging, and qualification by semiconductor-material users than from broad volume expansion of low-purity products.
