## Abstracts

According to our (Global Info Research) latest study, the global Gamma Irradiator market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A gamma irradiator is a device used for irradiation processes using gamma rays. It utilizes a radioactive source, typically cobalt-60 or cesium-137, which emits high-energy gamma photons. These gamma rays penetrate materials, killing microorganisms, sterilizing or preserving food, and modifying the properties of various products. The gamma irradiator is designed with shielding to prevent radiation leakage and ensure safety. It is commonly used in industries such as healthcare, food processing, research, and materials testing. Gamma irradiation offers advantages like deep penetration, uniform dosage, and no residual radioactivity, making it an effective method for various applications.

The industry trend of gamma irradiators is driven by increasing demand for sterilization, preservation, and quality control in various sectors. There is a growing focus on ensuring the safety and longevity of medical devices, pharmaceuticals, and food products. This trend involves the development of more efficient and compact gamma irradiation systems, advancements in dosimetry and process control, and increased automation for streamlined operations. Additionally, there is a continuous emphasis on improving safety protocols, waste management practices, and regulatory compliance to ensure the safe and responsible use of gamma irradiators.
