Abstracts

According to our (Global Info Research) latest study, the global GaN HEMT Die market size was valued at USD 24 million in 2022 and is forecast to a readjusted size of USD 56 million by 2029 with a CAGR of 12.8% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes. Gallium nitride (GaN) transistors offer fundamental advantages over silicon. In particular, the higher critical electrical field makes it very attractive for power semiconductor devices with outstanding specific dynamic on-state resistance and smaller capacitances compared to silicon MOSFETs, which makes GaN HEMTs great for high speed switching applications. Gallium nitride transistors can then be operated with reduced dead-times which results in higher efficiency and enables passive cooling. Operation at high switching frequencies allows the volume of passive components to shrink which improves GaN HEMTs reliability and overall power density.
