Abstracts

The global GaN MOCVD System market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

MOCVD (metal organic chemical vapor deposition) is a technology that is used to deposit very thin layers of atoms onto a semiconductor wafer (wafers are thin disks mostly made of sapphire or silicon). It is the most significant manufacturing MOCVD process for III-V compound semiconductors, especially for those based on Gallium Nitride (GaN). These semiconductors are the most important base materials for manufacturing red, blue, green and white LEDs. MOCVD systems meet early development and small-scale production needs for nitride applications. The system deposits high-quality GaN thin films suitable for a variety of applications including power, radio frequency and photonics.

This report studies the global GaN MOCVD System production, demand, key manufacturers, and key regions.
