## Abstracts

According to our (Global Info Research) latest study, the global Garment Hanger System market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The garment hanger system, also known as the flexible production system (FMS) or flexible production system, is a high-tech automation equipment in the "quick response production technology" of the clothing industry. Its working principle is to hang the cut pieces of the whole garment on the hanger and transport the hanger to each workstation through the main track. Each workstation processes the cut pieces according to the preset process. After the processing is completed, the production staff only needs to press the control button, and the hanging system will automatically transfer the hanger to the next process station. During the whole process, the system uses RFID, barcode recognition or chip recognition technology to identify and collect information on the hanger for real-time monitoring and scheduling.

The garment hanger system is widely used in clothing production enterprises, especially those that require large-scale production and multi-variety mixed production. Through this system, enterprises can realize the intelligence and efficiency of production processes, improve production efficiency and product quality, and reduce production costs and labor intensity.
