Gas Atomized Copper is a type of copper powder produced via gas atomization technology, commonly used for creating copper and copper alloy powders. This process involves injecting high-velocity gas through an atomizing nozzle, which breaks down the molten copper stream into fine particles. The atomized copper powder typically has a spherical shape, and varying atomization parameters and gas media (such as air or inert argon) can produce powders with different shapes and particle size distributions. Supersonic atomization is used to obtain finer powders. Gas-atomized copper powder is widely used in powder metallurgy, additive manufacturing, and the production of electrical and electronic components.
