According to our (Global Info Research) latest study, the global Gas Chromatography Tandem Mass Spectrometer market size was valued at USD 2564.2 million in 2022 and is forecast to a readjusted size of USD 3191.9 million by 2029 with a CAGR of 3.2% during review period.

Gas chromatography tandem mass spectrometer is an instrument that combines the characteristics of gas chromatography and mass spectrometry for analysis. Using gas chromatography and mass spectrometry together is much more precise in identifying and quantifying substances than using that part alone. It is impossible to accurately identify a specific molecule using gas chromatography or mass spectrometry alone. But usually, mass spectrometer processing requires very pure samples, and gas chromatography using traditional detectors cannot distinguish between multiple molecules when they pass through the column at the same time, which will cause two or more molecules to pass through the column at the same time. Similar patterns of ionized fragments also appear when the mass spectrometer detector is used alone. Combining these two methods reduces the possibility of error because it is very rare for two molecules to have the same chromatographic and mass spectrometric behavior

GC-MS consists of a mass spectrometer and a chromatographic analyzer. It is an efficient ion optical system for ultra-high sensitivity measurement. It can not only perform quantitative detection of trace substances, but also perform correct qualitative analysis of substances through mass spectrometry analysis, and can easily perform a variety of Compound search and determination. In the past, diagnostic methods for inherited metabolic diseases mostly used to examine one substance at a time, which

was efficient and low-cost. The application of GC-MS analysis technology has realized the correct determinacy and quantification of 'one-time detection of multiple substances', which has greatly improved the diagnostic efficiency of genetic metabolic diseases. Due to defects in enzyme or coenzyme metabolism, certain precursor metabolites accumulate in patients with hereditary metabolic diseases. Using GC-MS technology to detect abnormal metabolites in patients' body fluids can make biochemical diagnosis of some of these diseases.
