Abstracts

Gas Heat Pumps (GHPs) use the thermal energy released from burning a gaseous fuel to power a process which allows the system to extract energy from sources such as air, water or the ground in the form of heat. This heat can then be provided to a building or an industrial process. The process of heat extraction can also be reversed, allowing heat pumps to be used to provide cooling for air conditioning or Others purposes.

According to our (Global Info Research) latest study, the global Gas Heat Pump Air Conditioning Systems market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
