According to our (Global Info Research) latest study, the global Gas Iodine Sampler market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A gas iodine sampler is a device used to collect air samples for analyzing iodine isotopes. Iodine isotopes are radioactive isotopes of iodine, usually released into the environment during nuclear accidents or weapon tests. The sampler usually consists of a filter made of materials that can capture iodine isotopes, such as activated carbon or silver zeolite, placed in a position where air can pass through. Then collect the air on the filter and analyze it to determine the concentration of iodine isotopes. This information can be used to monitor the levels of iodine isotopes in the environment and ensure that they are within a safe range.
