According to our (Global Info Research) latest study, the global Gas Jet Vacuum Pump market size was valued at US\$ 675 million in 2024 and is forecast to a readjusted size of USD 913 million by 2031 with a CAGR of 4.4% during review period.

The gas jet vacuum pump is a type of jet vacuum pump that uses non-condensable gas as the transmission fluid. The working principle of the gas jet vacuum pump is to use a high-speed gas jet to carry the pumped gas, thereby forming a certain vacuum degree in the pumping container. Specifically, air enters the ejector under the action of pressure difference, and a supersonic airflow is ejected from a specific nozzle (such as a Laval nozzle). Due to the viscosity of the gas, the high-speed airflow will suck away the gas in the suction chamber, thereby forming a vacuum in the suction chamber.
