## Abstracts

According to our (Global Info Research) latest study, the global Gasoline Generator Sets market size was valued at USD 910.6 million in 2023 and is forecast to a readjusted size of USD 1239.1 million by 2030 with a CAGR of 4.5% during review period.

A gas generator is a device for generating gas. A gas generator may create gas by a chemical reaction or from a solid or liquid source, when storing a pressurized gas is undesirable or impractical.

The term often refers to a device that uses a rocket propellant to generate large quantities of gas. The gas is typically used to drive a turbine rather than to provide thrust as in a rocket engine. Gas generators of this type are used to power turbopumps in rocket engines, and are used by some auxiliary power units to power electrical generators and hydraulic pumps.

Another common use of the term is in the Industrial gases industry, where gas generators are used to produce gaseous chemicals for sale. For example, the chemical oxygen generator, which delivers breathable oxygen at a controlled rate over a prolonged period. During World War II, portable gas generators that converted coke to producer gas were used to power vehicles as a way of alleviating petrol shortages.

A generator set, also known as a genset, is the combination of an electrical generator and an engine mounted together to form a single piece of equipment that produces electrical power. In the generator, referred to as an alternator, the mechanical work of the engine generates electrical power. Generation sets are used in sites that are not

connected to the power grid or to supply emergency power when the grid fails. Generator sets may also be employed to produce energy during peak usage hours when the energy costs are the highest, to decrease the amount of electricity that must be purchased from the utility company, in a power-saving application called peak shaving.
