Abstracts

Gastric motility drugs, also known as prokinetic drugs, are drugs that promote the forward movement of gastrointestinal contents. When gastric motility is low, the emptying of gastric contents is delayed, which can cause many gastrointestinal diseases, such as nausea, vomiting, heartburn, postprandial discomfort, dyspepsia, etc., and can cause gastroesophageal reflux, leading to esophageal ulcer. Gastric motility drugs are used clinically to treat related diseases, such as reflux symptoms, reflux esophagitis, dyspepsia, intestinal obstruction and other common diseases.
