According to our (Global Info Research) latest study, the global Gastrointestinal Motility Marker market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Gastrointestinal motility markers consist of small radiopaque marker "particles" made of silica gel filled with barium sulfate (BaSO_4) within a hard-shell hydroxypropyl methylcellulose (HPMC) capsule. They work by delivering the marker to the stomach where it dissolves, passes through the gastrointestinal tract, and is excreted in the stool, allowing the approximate transit time of the entire colon to be measured, which is very useful in differentiating between normal and slow colonic transit times in patients with constipation and in the evaluation of unexplained diarrhea.
