According to our (Global Info Research) latest study, the global GBR & GTR Barrier Membranes market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Guided Bone Regeneration (GBR) and Guided Tissue Regeneration (GTR) barrier membranes are specialized materials used in dental and orthopedic procedures to facilitate the regeneration of bone and soft tissues. These membranes act as physical barriers that prevent the infiltration of surrounding soft tissues into the bone defect area, thereby allowing space for the desired bone or tissue to regenerate. GBR is primarily used in dental implantology and oral surgery to promote the growth of new bone around implants or in areas of bone loss. GTR, on the other hand, is often used in periodontal therapy to encourage the regrowth of periodontal tissues, including the bone, cementum, and periodontal ligament, around teeth affected by periodontal disease. These barrier membranes can be made from various materials, including resorbable polymers such as collagen and non-resorbable materials like expanded polytetrafluoroethylene (ePTFE), depending on the clinical requirements and desired outcomes.
