According to our (Global Info Research) latest study, the global Gear Box Gear market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The gearbox coupling tooth is a part used in the synchronizer in the automobile gearbox, which can realize the smooth switching between different gears and improve the power and fuel economy of the car. The structure of the gearbox combined with teeth is generally composed of a ring-shaped main body and a group of tooth shapes evenly distributed along the periphery. Its working principle is to change the transmission ratio and steering by meshing with gears on different shafts. There are generally the following four processing methods for the combination gear of the gearbox: forging the non-toothed tooth blank, and then machining and forming; It is formed by electron beam welding; it is directly formed by precision forging technology. Among them, the precision forging process is the future development direction of automotive gears, which can improve the strength and precision of gears, and reduce costs and material consumption.
