According to our (Global Info Research) latest study, the global Geiger-Muller Tube market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

A Geiger-Muller tube is a type of gas-filled detector used to measure ionizing radiation. It operates by detecting and counting the electrical pulses generated when radiation particles ionize the gas within the tube. The tube consists of a central wire (anode) and a cylindrical outer shell (cathode), with a high voltage applied between them. When radiation enters the tube, it ionizes the gas, creating ion pairs that are attracted to the electrodes, resulting in a measurable electrical pulse. Geiger-Muller tubes are commonly used in Geiger counters to detect and measure levels of radiation.
