Abstracts

The global Gel Card Tests market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The Gel Card Method is based on the principles of agglutination and hemagglutination. Agglutination is the clumping together of particles – in this case, red blood cells (RBCs). The RBCs will agglutinate when mixed with sera containing the corresponding antibodies. The degree of agglutination in the microtubes within the gel card is then used to determine the blood group.

A gel card test, also known as a gel agglutination test, is a type of diagnostic test used in immunohematology to determine blood compatibility, blood group typing, and the presence of specific antibodies in blood samples. Gel card tests utilize gel matrix technology to simplify and expedite the process of performing multiple blood tests simultaneously in a single platform.

This report studies the global Gel Card Tests production, demand, key manufacturers, and key regions.
