According to our (Global Info Research) latest study, the global Gel Electrophoresis market size was valued at USD 1314.5 million in 2023 and is forecast to a readjusted size of USD 1832.7 million by 2030 with a CAGR of 4.9% during review period.

Gel electrophoresis is a method for separation and analysis of macromolecules (DNA, RNA and proteins) and their fragments, based on their size and charge. It is used in clinical chemistry to separate proteins by charge and/or size (IEF agarose, essentially size independent) and in biochemistry and molecular biology to separate a mixed population of DNA and RNA fragments by length, to estimate the size of DNA and RNA fragments or to separate proteins by charge.

Personalized medicine is an umbrella term used for treatments tailor-made to suit individual patients' anatomy and morphology. Personalized medicines greatly increase the efficacy of treatments through companion diagnostics and genetic testing. These drugs minimize any adverse effects the treatment may have on the patient. Gel electrophoresis techniques are widely adopted in the field of personal medicine to accurately map and analyze the abnormal tissues or molecules responsible for causing the illness. Electrophoresis techniques such as two-dimensional difference gel electrophoresis provide quantitative, sensitive, reproducible, high-throughput, and exhaustive global protein expression profiling.

The Global Info Research report includes an overview of the development of the Gel Electrophoresis industry chain, the market status of Laboratory Research (Agarose Gel, Pulse Field Gel), Pharmaceutical and Biotechnological Companies (Agarose Gel, Pulse Field Gel), and key enterprises in developed and developing market, and analysed the
