Gel fiber hemostatic patch is a kind of medical dressing, which is usually used to control traumatic bleeding. It is made of cellulose or other fibrous materials, usually in the form of a bandage or patch. These dressings contain components that can promote coagulation, such as coagulation factors and fibrinogen. When the dressing comes into contact with the wound, these components will interact with platelets and plasma proteins in the blood to form clots and stop bleeding. The gel fiber hemostatic patch is usually used to stop bleeding after surgery and trauma, and can also be used to control other types of bleeding.
